INTRODUCTION:

Summit Hill, LLC is proposing the construction of 34 new residential duplex houses and 5 single-family detached dwellings on the two parcels totaling 17.725 acres at the end of Summit Street. The majority of the proposed dwellings will have a total floor area of approximately 2,080 square feet, distributed over two (2) stories.

Currently, the property is made up of 2 parcels. The entire site in general is a wooded area with little understory with some rock outcrops.

The stormwater runoff from the site flows in three directions: southwest to Coon Hollow Brook, which flows southerly and connects to an unnamed canal to the Housatonic River. To the northeast, where water flows to a tributary to the Naugatuck River that starts near Spring and Mohawk Ave. The southeast portion of the site flows southeast towards a tributary of the Naugatuck river which starts near the east end of Fall Street.

This site has an existing accessway to Summit Street. Two roadways are proposed for this development accessing Summit Street and Mountain Street in Derby. Upon completion of the development, garage parking will be provided for 78 cars; these spaces will be garage spaces located in the single houses 2-car garages, and the on car garage for each duplex unit.

EXISTING STORMWATER RUNOFF

For analysis purposes, the site has been examined as having four drainage areas. These four drainage areas will be referred to as DA-1 & DA-2(South west, North West drainage area flowing to Coon Hollow Brook), and DA-3 & DA-4 (North East and south East drainage area flowing to Mountain Street, and Fall Street).

Based on the above, it is apparent that there is three points of interest associated with the existing drainage pattern, the point immediately prior to the southwesterly portion of the property to a Coon Hollow Brook, where the site drains, and the two point immediately prior to the Northeasterly and southwesterly portions of the property. Peak rates of stormwater runoff, for 2, 10, 25, 50 and 100-year storm events, have been calculated for this point of interest. The rates are depicted on Table 1. The supporting calculations are included as Appendix A.

These existing flows will later be compared to post-development flows as a means of assessing the potential flow impact on surrounding infrastructures.

TABLE 1

Existing Flows (CFS)

Existing Runoff from the western watershed area to be developed

Drainage Area	2-Yr	10-Yr	25-Yr	50-Yr	100-Yr
DA-1 S. West	6.51	12.68	16.62	19.58	22.77
DA-2 N.West	3.99	7.71	10.09	11.87	13.79
WEST TOTAL	9.97	19.44	25.51	30.08	35.00

Existing Runoff from the eastern watershed area to be developed

DA-3 N. East	9.03	17.54	22.97	27.06	31.45
DA-4 S. East	8.96	17.41	22.81	26.87	31.23

PROPOSED STORM WATER DRAINAGE

The plans are designed to minimize potential impacts to adjacent properties and the existing stormwater infrastructure.

Without stormwater quality measures, the proposed development of this site will increase the Weighted Runoff Coefficient (WRC) and decrease the Time of Concentration (Tc), resulting in an increase in the peak rate of stormwater runoff. However, the construction of two (2) Storm Water Management Areas (SWMA) actually reduces the post-development rate of runoff relative to predevelopment conditions.

Design details for these systems are presented on Sheet SP-2 (part of the overall Project Documents). The system will drain the Roads, sidewalks, and grassy areas associated with the 34 new residential duplex houses and 5-single-family detached homes development. The Roads will be the major elements of the total impervious area on the site. (calculations included as Appendix A, Gutter flow analysis included as Appendix B) The roof, grassy areas, sidewalks, and driveways will contribute to the runoff totals seen in Table 2. The Roofs and driveways will be controlled by separate individual systems on each lot designed at a later time when the house's final layouts are known.

WEST POND

The Southwest Pond receives runoff from DA-1A, DA-2A, DA-3C and DA-4A. The basin provides approximately 100,937 cubic feet of storage with a maximum design depth of approximately 14.5 feet. Outlet control is provided through a low-flow outlet structure and an emergency overflow weir. The 100-year routed discharge from the pond is approximately 13.71 cfs.

NORTH SYSTEM

The North System receives runoff from DA-3A and consists of six rows of underground concrete chamber galleries approximately 100 feet in length. Total available storage is approximately 14,576 cubic feet. The system attenuates runoff from the northeastern drainage area before discharge to the downstream drainage network.

As indicated in the following summary and attached computations, the proposed development will reduce the peak rate of runoff to less than the pre-developed condition for all the water shed areas, Northwest, South West, Northeast, and Southeast on-site.

The development as proposed, will not have an adverse impact on the surrounding wetlands or watercourses.

Table 2, (below) represents the combined effect of these flow patterns on the existing infrastructures. Flows from the proposed systems will produce peak flows that are less than the existing peak flows from the two watersheds on the site.

TABLE 2

Proposed Flows (CFS) for new condition

Proposed Runoff from the western watershed area to be developed

Drainage Area	2-Yr	10-Yr	25-Yr	50-Yr	100-Yr
WEST TOTAL	3.193	5.924	7.511	8.677	15.55
Percent reduction	**-67.97%**	**-69.53%**	**-70.56%**	**-71.15%**	**-55.57%**

Proposed Runoff from the eastern watershed area to be developed

DA-3A N.East from galleries	7.92	15.71	20.45	23.91	27.58
Percent reduction	**-12.29%**	**-10.43%**	**-10.97%**	**-11.64%**	**-12.31%**
DA-4-B S.East	6.912	13.36	17.47	20.56	23.88
Percent reduction	**-22.86%**	**-23.26%**	**-23.41%**	**-23.48%**	**-23.54%**

SANITARY SEWER

Sanitary Sewer discharge will be through a proposed 8-inch PVC sanitary sewer line to the existing sewer main in Summit Street.

Using the technical standards of the Connecticut Public Health Code, the estimated sewage flow is 150 gallons per day per bedroom. This development will have no more than 219 bedrooms :

34 lots have 6 bedrooms + 5 lots have 3 bedrooms
(34 x 6) + (5x3)= 219 total bedrooms
219 x 150 = 32,850 gallons per day average flow

Average Daily Flow = 22.8 gpm per phase

Peak flow estimate = 22.8 x 5 (peaking factor) =114

= 114gpm Peak or 0.25 cfs

Other Utilities
All proposed utilities to the site will be through underground utility connections. Electrical service will be from existing aboveground electric utility line in proposed streets. Water service will be from an existing water main in the proposed streets.

- Aerial Photography

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:12,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: State of Connecticut, Western Part
Survey Area Data: Version 6, Sep 16, 2025

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Oct 21, 2022—Oct 27, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
60D	Canton and Charlton soils, 15 to 25 percent slopes	2.0	3.8%
73C	Charlton-Chatfield complex, 0 to 15 percent slopes, very rocky	2.0	3.7%
73E	Charlton-Chatfield complex, 15 to 45 percent slopes, very rocky	5.6	10.4%
75C	Hollis-Chatfield-Rock outcrop complex, 3 to 15 percent slopes	4.0	7.5%
75E	Hollis-Chatfield-Rock outcrop complex, 15 to 45 percent slopes	17.3	31.8%
229B	Agawam-Urban land complex, 0 to 8 percent slopes	2.2	4.1%
260B	Charlton-Urban land complex, 3 to 8 percent slopes	5.5	10.1%
260C	Charlton-Urban land complex, 8 to 15 percent slopes	0.3	0.6%
260D	Charlton-Urban land complex, 15 to 25 percent slopes	1.2	2.2%
273C	Urban land-Charlton-Chatfield complex, rocky, 3 to 15 percent slopes	0.3	0.6%
273E	Urban land-Charlton-Chatfield complex, rocky, 15 to 45 percent slopes	8.3	15.2%
306	Udorthents-Urban land complex	5.5	10.1%
Totals for Area of Interest		**54.3**	**100.0%**

State of Connecticut, Western Part

75E—Hollis-Chatfield-Rock outcrop complex, 15 to 45 percent slopes

Map Unit Setting

National map unit symbol: 9lqp
Landscape: Uplands
Elevation: 0 to 1,200 feet
Mean annual precipitation: 43 to 56 inches
Mean annual air temperature: 45 to 55 degrees F
Frost-free period: 140 to 185 days
Farmland classification: Not prime farmland

Map Unit Composition

Hollis and similar soils: 35 percent
Chatfield and similar soils: 30 percent
Rock outcrop: 15 percent
Minor components: 20 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Hollis

Setting

Landscape: Uplands
Landform: Bedrock controlled ridges, Bedrock controlled hills
Down-slope shape: Convex
Across-slope shape: Convex
Parent material: Loamy melt-out till derived from granite and/or schist and/or gneiss

Typical profile

Oa - 0 to 1 inches: highly decomposed plant material
A - 1 to 6 inches: gravelly fine sandy loam
Bw1 - 6 to 9 inches: channery fine sandy loam
Bw2 - 9 to 15 inches: gravelly fine sandy loam
2R - 15 to 80 inches: bedrock

Properties and qualities

Slope: 15 to 45 percent
Surface area covered with cobbles, stones or boulders: 9.0 percent
Depth to restrictive feature: 10 to 20 inches to lithic bedrock
Drainage class: Somewhat excessively drained
Runoff class: High
Capacity of the most limiting layer to transmit water (Ksat): Low to high (0.01 to 5.95 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water supply, 0 to 60 inches: Very low (about 1.8 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 7s
Hydrologic Soil Group: D
Ecological site: F144AY033MA - Shallow Dry Till Uplands
Hydric soil rating: No

Description of Chatfield

Setting

Landscape: Uplands
Landform: Bedrock controlled ridges, Bedrock controlled hills
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Coarse-loamy melt-out till derived from granite and/or schist and/or gneiss

Typical profile

Oa - 0 to 1 inches: highly decomposed plant material
A - 1 to 6 inches: gravelly fine sandy loam
Bw1 - 6 to 15 inches: gravelly fine sandy loam
Bw2 - 15 to 29 inches: gravelly fine sandy loam
2R - 29 to 80 inches: unweathered bedrock

Properties and qualities

Slope: 15 to 45 percent
Surface area covered with cobbles, stones or boulders: 1.6 percent
Depth to restrictive feature: 20 to 40 inches to lithic bedrock
Drainage class: Well drained
Runoff class: High
Capacity of the most limiting layer to transmit water (Ksat): Low to high (0.01 to 5.95 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water supply, 0 to 60 inches: Low (about 3.3 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 7s
Hydrologic Soil Group: B
Ecological site: F144AY034CT - Well Drained Till Uplands
Hydric soil rating: No

Description of Rock Outcrop

Typical profile

R - 0 to 0 inches: bedrock

Properties and qualities

Slope: 15 to 45 percent
Depth to restrictive feature: 0 inches to lithic bedrock
Runoff class: Very high

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 8
Hydrologic Soil Group: D
Hydric soil rating: Unranked

Minor Components

Charlton

Percent of map unit: 7 percent
Landscape: Uplands
Landform: Hills
Down-slope shape: Linear
Across-slope shape: Linear
Hydric soil rating: No

Sutton, very stony

Percent of map unit: 5 percent
Landscape: Uplands
Landform: Drainageways, Depressions
Down-slope shape: Concave
Across-slope shape: Linear
Hydric soil rating: No

Leicester

Percent of map unit: 5 percent
Landscape: Uplands
Landform: Drainageways, Depressions
Down-slope shape: Linear
Across-slope shape: Concave
Hydric soil rating: Yes

Brimfield

Percent of map unit: 1 percent
Landscape: Uplands
Landform: Bedrock controlled ridges, Bedrock controlled hills
Down-slope shape: Convex
Across-slope shape: Convex
Hydric soil rating: No

Unnamed, red parent material

Percent of map unit: 1 percent
Hydric soil rating: No

Unnamed, sandy subsoil

Percent of map unit: 1 percent
Hydric soil rating: No

Hydraflow HGL Computation Procedure

General Procedure:

Hydraflow computes the HGL using the Bernoulli energy equation. Manning's equation is used to determine energy losses due to pipe friction. In a standard step, iterative procedure, Hydraflow assumes upstream HGLs until the energy equation balances. If the energy equation cannot balance, supercritical flow exists and critical depth is temporarily assumed at the upstream end. A supercritical flow Profile is then computed using the same procedure in a downstream direction using momentum principles.

Col. 1 The line number being computed. Calculations begin at Line 1 and proceed upstream.

Col. 2 The line size. In the case of non-circular pipes, the line rise is printed above the span.

Col. 3 Total flow rate in the line.

Col. 4 The elevation of the downstream invert.

Col. 5 Elevation of the hydraulic grade line at the downstream end. This is computed as the upstream HGL + Minor loss of this line's downstream line.

Col. 6 The downstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

Col. 7 Cross-sectional area of the flow at the downstream end.

Col. 8 The velocity of the flow at the downstream end, (Col. 3 / Col. 7).

Col. 9 Velocity head (Velocity squared / 2g).

Col. 10 The elevation of the energy grade line at the downstream end, HGL + Velocity head, (Col. 5 + Col. 9).

Col. 11 The friction slope at the downstream end (the S or Slope term in Manning's equation).

Col. 12 The line length.

Col. 13 The elevation of the upstream invert.

Col. 14 Elevation of the hydraulic grade line at the upstream end.

Col. 15 The upstream depth of flow inside the pipe (HGL - Invert elevation) but not greater than the line size.

Col. 16 Cross-sectional area of the flow at the upstream end.

Col. 17 The velocity of the flow at the upstream end, (Col. 3 / Col. 16).

Col. 18 Velocity head (Velocity squared / 2g).

Col. 19 The elevation of the energy grade line at the upstream end, HGL + Velocity head, (Col. 14 + Col. 18) .

Col. 20 The friction slope at the upstream end (the S or Slope term in Manning's equation).

Col. 21 The average of the downstream and upstream friction slopes.

Col. 22 Energy loss. Average Sf/100 x Line Length (Col. 21/100 x Col. 12). Equals (EGL upstream - EGL downstream) +/- tolerance.

Col. 23 The junction loss coefficient (K).

Col. 24 Minor loss. (Col. 23 x Col. 18). Is added to upstream HGL and used as the starting HGL for the next upstream line(s).
